1 Overview

T40A is a smart video application processor targeting for video devices like mobile camera, security survey, video talking, video analysis and so on. This SoC introduces a kind of innovative architecture to fulfill both high performance computing and high quality image and video encoding requirements addressed by video devices. T40A provides high-speed CPU computing power, excellent image signal process, fluent 3840x2160 resolution video recording.

The CPU (Central Processing Unit) core, equipped with 32kB instruction and 32kB data L1 cache, and 128kB~1024kB configurable L2 cache, operating at 1.0GHz, and full feature MMU function performs OS related tasks. At the heart of the CPU core is XBurst®-2 processor engine. XBurst®-2 is an industry leading microprocessor core which delivers superior high performance and best-in-class low power consumption. A hardware floating-point unit which compatible with IEEE754 2008 and MIPS32 ISA R5 plus MIPS SIMD instruction set architecture:512bit MSA also included.

The VPU (Video Processing Unit) core is a video encoder engine designed to process video streams using the HEVC(ISO/IEC 23008-2 High Efficiency Video Coding) and AVC(ISO/IEC 14496-10 Advanced Video Coding) standards. It also supports still picture encoding using the JPEG standard(ITU T.81). Together with the on chip video accelerating engine and post image processing unit, T40A delivers high video performance. The maximum resolution of 4096x4096 in the format of AVC are supported in encoding. Up to 40Mbit/s for H.264, 20Mbit/s for H.265, 1080P@60fps.

The ISP (Image signal processor) core supports excellent image process with the image from up to 3 sensors. Supports DVP, MIPI and TOF sensors. With the functions, such as 3A, 2D and 3D denoise, WDR/HDR, lens shading and so on. It can supply maximum resolution 3840x2160 resolution image for view or encoding to store or transfer.

On-chip modules such as audio CODEC, multi-channel SAR-ADC controller and camera interface offer designers a economical suite of peripherals for video application. WLAN, Bluetooth and expansion options are supported through high-speed SPI and eMMC/SD/SDIO host controllers. Other peripherals such as USB OTG, MAC, UART and SPI as well as general system resources provide enough computing and connectivity capability for many applications.

3.4.2 Analog Interface Description

3.4.2.1 Microphone input

There are two inputs channels named left ADC channel and right ADC channel. In the each channel, there are two inputs which are configured as differential input by the microphone PGA(MICL and MICR).

In the left channel, microphone inputs are MICPL and MICNL. In the right channel, microphone inputs are MICPR and MICRL.

Microphone PGA has a gain range from 0dB to 20dB.

3.4.2.2 ALC

Automatic Level Control (ALC) function is included to adjust the signal level, which is input into ADC. ALC will measure the signal magnitude and compare it to defined threshold. Then it will adjust the ALC controlled PAG (ALC_L and ALC_R) gain according to the comparison result.

The programmable gain range of ALC controlled PAG is from -18dB to +28.5dB. The tuning step is 1.5dB.

3.4.2.3 DAC OUTPUT

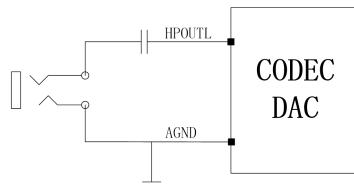

Support headphone output or line output configurations. The output can drive load through DC-blocking capacitor.

In the configuration using DC-blocking capacitor, shown in the following figure, the headphone ground

is connected to the real ground. The capacitance and the resistance determine the lower cut-off frequency. For instance, if 600Ω load and $4.7\mu F$ DC-blocking capacitor is used, the lower cut-off frequency is:

$$f = \frac{1}{2 \times R C} = \frac{1}{2 \times 600 \times 4.7 \times 10^{-6}} = 56.5\text{Hz}$$

The DC-blocking capacitor can be increased to lower the cut-off frequency for better bass response.

The out driver has a gain range from -39dB to +6dB with a tuning step of 1.5dB.

3.4.2.4 Microphone Bias

The output of the Microphone bias is used for bias external microphones. The bias voltage can vary from $0.8 * \text{CODEC_AVDD}$ to $0.975 * \text{CODEC_AVDD}$ with a step of $0.025 * \text{CODEC_AVDD}$.

Microphone PGA has a gains range from 0dB to 20dB.

3.5 MIPI Tx D-PHY

MIPI D-PHY contains tunable source termination and pre-emphasis to enable high speed operation. The Transceiver meets the AC specification below across all operating conditions specified.

3.8 Power On, Reset and BOOT

3.8.1 Power-On Sequence

The external voltage regulator and other power-on devices must provide the T40A processor with a specific sequence of power and resets to ensure proper operation. Figure 3-2 shows this sequence and Table 3-18 gives the timing parameters. Following are the name of the power.

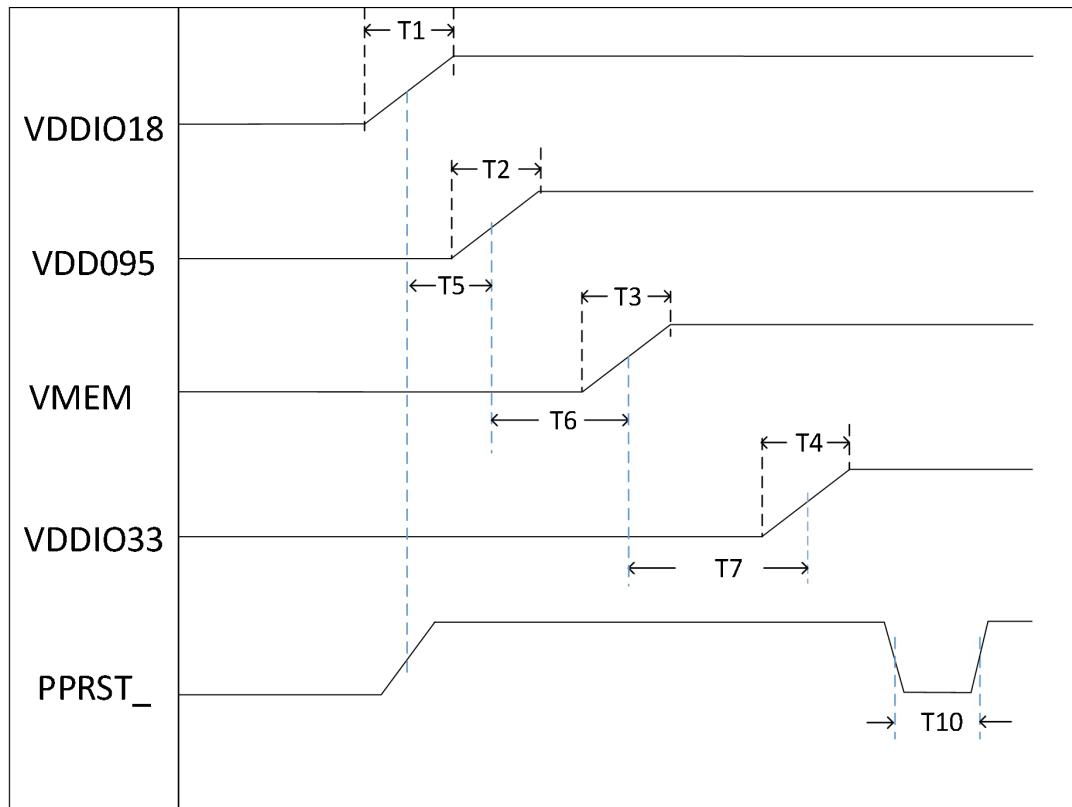

- VDD095: all 0.95V power supplies: VDD, CSI_VCC09, DSI_VCCA09, USB_AVDD09, PLL_VDD
- VMEM: DDRVDD, VDDMEM
- VDDIO18: all other digital IO: VDDIO, VDDIO18, VDDIO18_DVP, VDDIO3318_DVP, PLL_AVDD, SADC_AVDD, CODEC_AVDD, USB_AVD18, CSI_VCCA18, DSI_VCCA18, DDRPLL_VCCA
- VDDIO33: VDDIO33, VDDIO3318_DVP, USB_AVD33

NOTES:

- [1]: The power rise time is defined as 10% to 90%.
- [2]: The PPRST_ must be kept at least 100us.

PPRST_ reset mode

POR reset mode

Figure 3-2 Power-On Sequence Diagram

3.8.2 Reset procedure

There are 3 reset sources: 1. PPRST_ pin reset; 2. POR hardware reset and 3.WDT timeout reset . After reset, program start from boot.

- **PPRST_ pin reset.**
This reset is triggered when PPRST_ pin is put to logic 0. It happens in power on RTC power and RESET-KEY pressed to reset the chip from unknown dead state. The reset end time is about 1M EXCLK cycles after rising edge of PPRST_.
- **POR(Power-On-Reset) hardware reset.**
The chip POR circuit provides reliable reset function for general applications. Powered by 1.8V analog supply and monitors 0.95V digital and 1.8V analog supply. It generates reset signal to digital logic. Set low if analog supply or digital supply is below the threshold voltage(typical 1.35V threshold for 1.8V supply and 0.6V threshold for 0.95V supply), and will be set high if both of analog supply and digital supply exceed the threshold voltage.
- **WDT reset.**

This reset happens in case of WDT timeout. The reset keeps for about a few RTCLK cycles. After reset, all GPIO shared pins are put to GPIO input function(excluded JTAG pins) and most of their internal pull-up/down resistor are set to on, see “2.5Pin Description” for details. The oscillators are on.

3.8.3 BOOT

The boot sequence of the T40A is controlled by boot_sel[1:0]. The configuration is shown as follow:

Table 3-19 Boot Configuration of T40A

boot_sel[1:0]	Boot method
00	MMC/SD boot @ MSC0 (MMC/SD use GPIO Port B. MSC1 use GPIO Port C)
01	SFC boot @ CS4 (SPI boot)
10	NOR boot @ CS2(just for FPGA testing)
11	USB boot @USB2.0 device, EXTCLK=24MHz

Note:

1. When SFC boot start failure, the program in bootrom will go into MSC0 boot, If it is boot from MMC/SD card at MSC0, its function pins MSC0_D0, MSC0_CLK, MSC0_CMD are initialized, the boot program loads the maximum 100KB code from MMC/SD card to cache and jump to it. Only one data bus which is MSC1_D0 is used.
2. When MSC0 boot start failure, the program in bootrom will go into MSC1 boot, If it is boot from MMC/SD card at MSC1, its function pins MSC1_D0, MSC1_CLK, MSC1_CMD are initialized, the boot program loads the maximum 100KB code from MMC/SD card to cache and jump to it. Only one data bus which is MSC1_D0 is used. If MSC1 boot start failure, jump to USB boot.

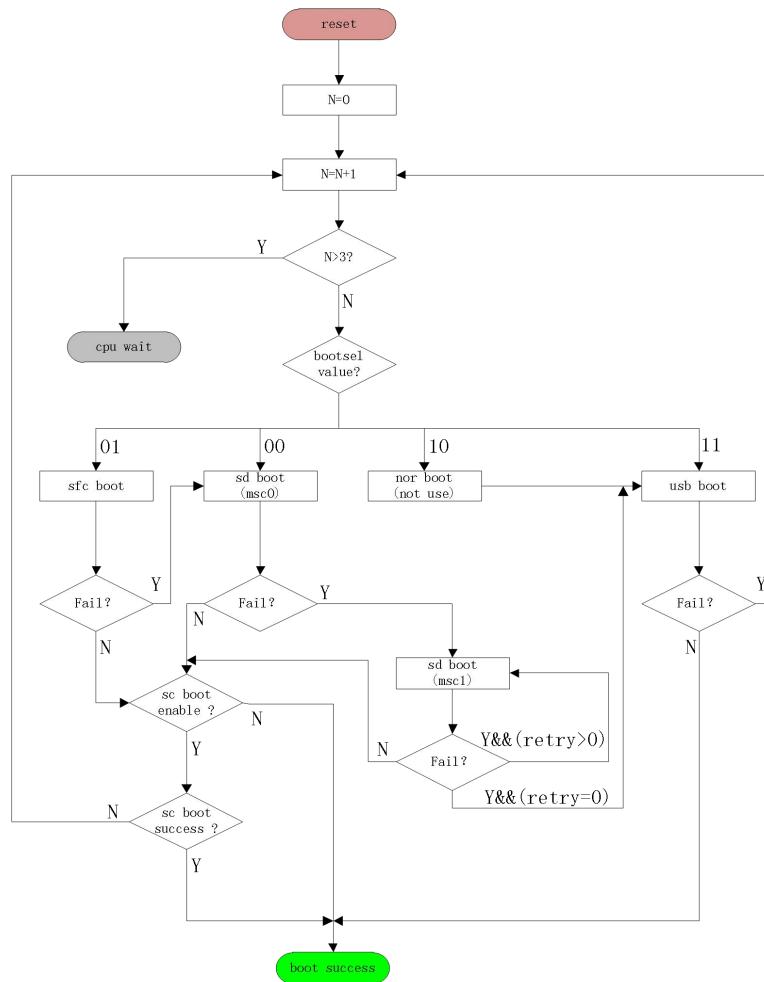

Figure 3-3 Boot sequence diagram of T40A

As shown in boot sequence Block Diagram, After reset, the boot program on the internal boot ROM executes as follows:

- 1 Disable all interrupts and read boot_sel[0] and boot_sel[1] to determine the boot method.
- 2 There 26KB backup reading failed, the 26KB backup at 128th, 256 th , ..., and finally 1024th page will be tried in consecutive order.
- 3 If it is boot from MMC/SD card at MSC0, its function pins MSC0_D0, MSC0_CLK, MSC0_CMD are initialized, the boot program loads the maximum 100KB code from MMC/SD card to cache and jump to it. Only one data bus which is MSC0_D0 is used.
- 4 If it is boot from USB, a block of code will be received through USB cable connected with host PC and be stored in cache. Then branch to this area in cache.
- 5 If it is boot from SPI nor/nand at SFC, its function pins SFC_CLK,SFC_CE, SFC_DR,SFC_DT, SFC_WP,SFC_HOLD are initialized,the boot program loads the maximum 100KB code from SPI NAND/NOR flash to cache and jump to it.
